## Attachment II

Associated articles are nursery stock of the following species: Twenty-nine additional plant species have been identified as associated with P. ramorum because results of culture or Polymerase Chain Reaction (PCR) tests returned positive results for the fungus. For each of these plant species, traditional Koch's postulates have not yet been completed or documented and reviewed, but given the positive results of culture or PCR tests, we believe it is necessary to restrict the interstate movement of these hosts until the results of Koch's postulates are complete. When the results of Koch's postulates are complete, we will address the issue by listing positive articles as regulated and restricted articles, and by removing from regulation plant species that return negative results.
